**PROPOSAL FOR THE TREATMENT OF CANCER WITH COMPLEMENTARY
AND ALTERNATIVE THERAPIES**

By: Fernando Gutiérrez Vigna MD.

Dear colleague, I very respectfully allow myself to present to you the basic scheme of Complementary and Alternative Medicines (CAM) for the treatment of cancer and chronic and consumptive pathology in general. Recently the American Cancer Society of the United States has announced the appearance of its first text on alternative therapies in the fight against cancer. For its part, the National Institute of Health of Bethesda (Maryland) has established for the important centers and universities of the country, the initiation of research and therapeutic protocols, clinical trials and publication of results, carried out with alternative medicine. Such an initiative stems from two confirmed facts: first, the not insignificant therapeutic results obtained in light of conventional protocols of some alternative treatments, and second, special attention to spending on alternative medicines in the United States of America and other countries from 1998. As stated in the report published by the World Health Organization "WHO Strategy on Traditional Medicine 2002-2005.

For example:

Green Sap

There are still many who look at Phytomedicine with distrust, especially in diseases such as cancer. However, a phytomedicinal product developed in Uruguay by the Uruguayan Ecological Laboratory is showing great possibilities in the treatment of cancer and, above

all, in improving the quality of life of those patients who decide to combine conventional treatment with homeopathic treatment. It is made up of a mixture of three plants: plantain, carqueja and rosemary. And to its effectiveness is added the fact that it does not cause side effects and is harmless even at large doses. The team that is behind its development is coordinated by an oncologist, Bernardo Udaquiola -Head of Ward at the National Institute of Oncology of Uruguay and probably the doctor with the largest casuistry in the last 5 years of the National Program against Breast Cancer. "Undoubtedly, the drops are an alternative to conventional treatments since they complement conventional therapy by reducing all the adverse effects caused by it, be it chemotherapy or radiotherapy, in addition to having a proven antitumor property. "Its application is not allowed in the Institute by the norms of the Ministry of Public Health, but I am not questioned regarding its use as a therapeutic resource at a private level and in the same way I refer my patients to serious colleagues in the practice of complementary medicine" The components that make up the authorized drug by the MSP of Uruguay and other countries of the world that are widely used in clinics. It is not as toxic as the starting substances, while offering a stronger antitumor effect. In the final product there is no thiotepa in a free state that can be detected by gas chromatography. •••• It is toxic in therapeutic doses against cancer cells, but it does not attack healthy cells. After being injected, it accumulates (concentrates) rapidly in the tumor region. It gives rise to the encapsulation of large tumors thanks to its antiangiogenic effect (it prevents the formation of tumor vessels), thus facilitating the operability of tumors, regenerates the immune system.

Its strong action as an anticancer drug has been demonstrated at the hospital level and also in numerous treatments carried out with outpatients, giving the case of remissions caused by Green Sap that have continued to be maintained after having elapsed 9 years after therapy. Randomized clinical studies have shown that these therapeutic successes are not mere chance, but have been achieved thanks to the antitumor properties of Green Sap.

Green Sap stops the cell cycle of pancreatic cancer cells in prophase by inhibiting the polymerization of tubulin (an important step in cell division) and reducing the multiplication of pancreatic cancer cells, causing their apoptosis (programmed cell death). In vitro studies conducted at the National Cancer Institute (Bethesda, Maryland, USA) have shown Green Sap (NSC 631570) to be toxic only to cancer cells against all solid cancer cell lines that have been examined. This is something that has been confirmed in cases of melanomas, brain tumors, ovarian and kidney cancer, lung carcinomas.

Systemic Medicine has carried out protocols for the treatment of cancer, AIDS, and many chronic pathologies, whose validity is accredited by a large number of scientific studies whose main support is the therapeutic action of different combinations of adaptogens. Among the most important, there are plants, already considered "superior" by the ancient oriental knowledge and that for thousands of years stood out for their indisputable healing qualities.
